                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence represents human TANGO 229 polypeptide. This protein and CC similar others exhibit the ability to affect growth, proliferation, cc survival, differentiation, activity, morphology, or movement/migration of, e.g. T cells and cells of the heart, liver, pancreas, placenta, CC brain, lung, skeletal muscle, kidney, spleen, lymph node, peripheral blood leukocyte, bone marvo or thymus tissue. They can be used as condulating agents for regulating cellular processes, thus, the proteins and their associated nucleic acids can be used to prognosticate, prevent, CC diagnose, or treat disorders associated with physiological processes. These disorders include abnormal blood coagulation, asthma, anaphylaxis, hepatitis, multiple sclerosis, cancer, coronary artery disease, malaria, atopic dermatitis, amyotrophic lateral sclerosis, meningitis, attention deficit disorder, Crohm's disease, gastroenteritis, goltre, hypoglycaemia, diabetes mellitus, endometriosis, pulmonary embolism and muscular dystrophy. Antibodies to disorders such as these can be made by providing a polypeptide of the invention to an immuno-competent vertebrate and harvesting blood or serum from the vertebrate.

     The sequence represents a novel human protein (NHP) containing a CUB domain (an extracellular domain). CUB proteins have been associated with regulating development, modulating cellular processes and preventing infectious disease. NHP nucleotide sequences are useful for gene therapy of physiological disorders or diseases. NHP oligonucleotides are useful as hybridisation probes for screening libraries and assessing gene patterns. NHP nucleotide sequences are useful for detecting mutant or inappropriately expressed NHPs (for example, those proteins associated with obesity, high blood pressure, connective tissue disorders and infertility) for the diagnosis of a disease. The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleotide constructs encoding NHP products are used to
the body. Nucleotide genetically engineer

regulating development, modulating cellular processes and preventing infectious disease. NHP nucleotide sequences are useful for gene therapy of physiological disorders or diseases. NHP oligonucleotides are useful as hybridisation probes for screening libraries and assessing gene patterns. NHP nucleotide sequences are useful for detecting mutant or inappropriately expressed NHPs (for example, those proteins associated with obesity, high blood pressure, connective tissue disorders and infertility) for the diagnosis of a disease. The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleotide constructs encoding NHP products are used to genetically engineer host cells to express such products in vivo. These host cells allow for the identification of compounds that bind to NHP receptors or trigger NHP-mediated pathways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence represents a novel human domain (an extracellular domain).                                                                                                                                                                                                                                                                 CC The sequence represents a novel human protein (NHP) containing a CUB CC domain (an extracellular domain). CUB proteins have been associated with CC regulating development, modulating cellular processes and preventing CC infectious disease. NHP nucleotide sequences are useful for gene therapy CC of physiological disorders or diseases. NHP oligonucleotides are useful as hybridisation probes for screening libraries and assessing gene CC patterns. NHP nucleotide sequences are useful for detecting mutant or CC inappropriately expressed NHPs (for example, those proteins associated CC with obesity, high blood pressure, connective tissue disorders and CC infertility) for the diagnosis of a disease. The polynucleotides may also CC be used in screening for drugs effective in the treatment of symptomatic CC the body. Nucleotide constructs encoding NHP products are used to CC genetically engineer host cells to express such products in vivo. These CC cost cells allow for the identification of compounds that bind to NHP can be compounded to the compounds that bind to NHP constructs or trigger NHP-mediated pathways.

The present sequence represents a polypeptide sequence which is isolated from lymph node stromal cells of fsn -/- mice. The polynucleotides and their polypeptides are useful for treating an inflammatory disorder, disorder of immune system and cancer selected from epithelial, lymphoid, mysloid, stromal and neuronal cancers, a viral disorder, in particular HIV infection and for modulating the growth of blood vessels. The polypeptides are useful for treating a

It is also useful in assay to determine biological activity, to raise antibodies, to isolate corresponding ligands or receptors, to quantify levels of protein or cognate corresponding ligand or receptors, as antiinflammatory agents, and in compositions for the treatment of skin, connective tissue and immune system diseases. The polynucleotide is useful as marker for tissue, as a chromosome marker or tags in the identification of a genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to neuropilin-like polypeptide (neuropilin-Hyl and neuropilin-Hyl) and their corresponding nucleic acids. The neuropilin-like polypeptides and polynucleotides are useful in modulating neuronal growth regenerative capacity, treating neurodegenerative diseases, diagnosing and mapping genetic neuronal defects and degenerative diseases like Alzheimer's disease and for treating learning and memory disorders. They are also useful for inducing angiogenesis, neovascularisation, as well as organ growth and development e.g. heart and other tissues. Antagonists of neuropilin-like polypeptides are useful for treating cancers and other malignant diseases. Neuropilin is used to treat platelet disorders e.g. thrombocytopaenia, plastic anaemia and paroxysmal nocturnal haemoglobinuria and is used in nerve tissue growth or
                                                                                                                                                                                                                                                                                                            regeneration, in wound healing, tissue repair and replacement and in healing of bones, incisions and ulcers. Compositions comprising the sequences of the invention are useful for treating diseases of peripheral nervous system e.g. Parkinson's disease, Huntington's disease, Shy-Drager syndrome, amyotrophic lateral sclerosis, and traumatic disorders e.g. spinal cord disorders, head trauma and cerebrovascular diseases e.g. stroke, ulcers, immune deficiencies and immune disorders, infections by hepatitis viruses, human immunodeficiency virus (HIV), herpes viruses, muscoharteria reishmania con malaria son antrimune disorders e.g.
inflammatory eye disease. The gene therapy techniques. The protein. Neuropilin-Hyl gene

Concern neuropilin-Hyl and Hy2 are located on human chromosome 6q21.

Concern neuropilin-Hyl and Hy2 are located on human chromosome 6q21.

Concern neuropilin-Hyl and Hy2 are located on human chromosome 6q21.

Concern neuropilin-Hyl and Hy2 are located on human chromosome 6q21.

Concern neuropilin-Hyl and Hy2 are located on human chromosome 6q21.

Concern neuropilin-Hyl and Hy2 are located on human chromosome 6q21.

Concern neuropilin-Hyl and Hy2 are located on human chromosome 6q21.

Concern neuropilin-Hyl and Hy2 are located on human chromosome 6q21.

Concern neuropilin-Hyl neuropilin-Like proteins and encoding cDNAs are useful concern neuropilin-Like proteins and degenerative diseases like concern neuropilin-Like proteins and lesions, infectious systems, concern neuropilin-Like proteins and cDNAs are also useful as markers for cancers. The neuropilin-Like proteins and lesions caused by toxic substances.

Concern neuropilin-Like proteins and cDNAs are also useful as markers for cancers. The neuropilin-Like proteins and lesions caused by toxic substances.

Concern neuropilin-Like proteins and cDNAs are also useful as markers for cancers. The neuropilin-Like proteins and lesions caused by toxic substances.

Concern neuropilin-Like proteins and cDNAs are useful for regulating cell for regulating cell concern neuropilin-Like proteins and lesions caused by toxic substances.

Concern neuropilin-Like proteins and cell growth factor activity, for inducing proliferation of neural cells, regeneration of nerve and concern neuropilin-Like proteins are useful for regulating cells.

Concern neuropilin-Like proteins and lesions caused by toxic substances.

Concern neuropilin-Like proteins neuropilin-Like proteins are useful neuropility.

It has haemostatic and cerebroprotective activities. The F8H contains a Factor 5/8 signature and is useful as a therapeutic for treating coagulation related diseases such as haemophilia and stroke. The nucleic acid is useful as such as haemophilia and stroke. The nucleic acid is useful as hybridisation probe and amplification primer for detecting deficiencies in the level of F8H mRNA, for screening F8H gene mutations and for monitoring regulation of gene expression. Fragments of the nucleic acid are also useful as diagnostic probes and primers, and can be used in screening methods such as those using DNA.chips. The present sequence is also useful as a target to screen therapeutically useful modulators
                                                                                                                                                                                                                                                                                                                                  Sequence

AAAI3243 CO AMADIANA MARCHARM AND AND PROTECTIONS (P), where cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The color cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletic

rectifying mutations or deletions

AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon

proteins (P), where

Nucleic acids encoding useful for preventing,

4277 human diagnosing

colon cancer-associated polypeptides, and/or treating colorectal cancers -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the

                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                  diseases, and neuropathles, such as Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, to regulate haematopoiesis and treat myeloid and lymphoid cell disorders, various anaemias, and platelet disorders, such as thrombocytopaenia, regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and as a food supplement or molecular weight marker. The cDNAS are useful in gene identification, genome mapping, transgenics, as hybridisation probes, for primer design, for gene chips and as a DNA antigen. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 neurodegenerative diseases, learning and memory disorders, diagnosing an mapping genetic neuronal defects and degenerative diseases like Alzheimer's disease, for inducing angiogenesis, and neovascularisation and organ growth and development (e.g. the heart). The nervous systems disorders include lesions of central or peripheral nervous systems, including traumatic lesions, ischaemic lesions, infectious lesions, including traumatic lesions, schaemic lesions, infectious lesions, degenerative lesions, lesions associated with nutritional diseases or disorders, neurological lesions, and lesions caused by toxic substances. The neuropilin-like proteins and cDNAs are also useful as markers for cancers. The neuropilin-like proteins are useful for regulating cell proliferation, cell differentiation, stem cell growth factor activity, for inducing proliferation of neural cells, regeneration of nerve and brain tissue, for treatment of central and peripheral nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated neuropilin-like polypeptide including neuropilin-Hyl and neuropilin-Hy2, the full length cDNAs encoding the proteins and the coding compose of the cDNAs. Also incide a nucleic acid array comprising the cDNAs attached to a surface for detecting full-matches or mismatches to the cDNAs. The genes for neuropilin-Hyl and Hy2 are located on human chromosome 6q21. The nucleic acid array is useful for detecting full-matches or mismatches or mism
                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        in modulating neuronal growth, regenerative capacity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          to the cDNAs. The neuropilin-like proteins and encoding cDNAs are useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                             diagnosing and mapping genetic neuronal defects and degenerative diseases like Alzheimer's disease and for treating learning and memory disorders. They are also useful for inducing angiogenesis, neovascularisation, as well as organ growth and development e.g. heart and other tissues. Antagonists of neuropilin-like polypeptides are useful for treating cancers and other malignant diseases. Neuropilin is used to treat platelet disorders e.g. thrombocytopaenia, plastic anaemia and paroxysmal nocturnal haemoglobinuria and is used in nerve tissue growth or regeneration, in wound healing, tissue repair and replacement and in
                                                                                                                                                                                                                                                                                                                                                               Novel isolated human Neuropilin-Hyl and Neuropilin-Hyl polypeptides useful for treating neurodegenerative diseases e.g. Alzhelmer's disease, and for diagnosing and mapping genetic neuronal defects -

                                                                                                                                                                                                                                                                                                                                                                              correct sensory afferent innervation and other aspects of development. Agents which inhibit or enhance the interaction of a semaphorin and a neurophilin can be potent modulators of nerve cell growth, immune responsiveness, and viral pathogenesis, and can be used in the treatment and diagnosis of neurological disease, neuro-regeneration, immune modulation including hypersensitivity and graft-rejection, and diagnosis and treatment of viral and oncological infection/diseases. The neuropilins, neuropilin-encoding nucleic acids, and unique portions also are useful in screening chemical libraries for regulators of semaphorin-mediated cell activity, and in genetic mapping as probes for related genes, as diagnostic reagents for genetic, neurological, immunological and oncological disease.
                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The neuropilins are type I transmembrane proteins and act as semaphorin III (Sema III) receptors. The semaphorins have been shown to function in repulsive axon guidance. Sema III is a secreted protein that in vitro causes neuronal growth cone collapse and chemorepulsion on neurites and is regulared in vivo for
